

## The Invisible Wall:

Want to draw a wall between your roommate and yourself to have your privacy? Or do you want a flexible curtain-like barrier to simply organize your space? With the increasing population and the lack of space, these requirements will become inevitable and necessary. The Invisible Wall will be a slab that extends into a wall to make customized spaces and optimize construction and living costs. You can control its dimensions, flexibility or transparency. It is used to introduce dividers in spaces where you need to isolate a particular perimeter from the others. For instance, we need to set a cabin up for camping in the woods, one can simply carry these slabs—stretch them to the required dimensions and create a temporary living cubicle in any location. The wall emerging out of these slabs can be modified according to its application. This also helps people to use the same space for different purposes. For instance, you can use the same space with minimum transparency and minimum malleability to create a rigid private space, or

maximum transparency and minimum malleability to stay secured while viewing the outer world and the wildlife in the woods.

**I see one of the biggest use-cases for the same to provide females with convenient portable private spaces to change clothes, freshen up, or even use the toilet in otherwise open spaces. This would help them travel through long distances easily and even take care of their personal hygiene.**
